## CORN PRODUCTION IN KANSAS, 1928-39 INCLUSIVE

### - By Counties -

Planted corn acreage in Kansas was almost one million acres higher in 1932 and 1933 than the average acreage for the 4 years prior to 1932. Beginning with 1934, however, declines in planted corn acreage occurred in all crop reporting districts of the State. Acreage declines continued through 1939 in the west central and southwestern districts. Increases in corn acreage occurred in the rest of the State in 1939 compared with 1938. The low point in at least 63 years for the State as a whole was 2,456,000 acres planted to corn in 1938. Harvested acreage of corn has exceeded this figure every year since 1876 except in 1937 and 1938.

The return of more nearly normal growing conditions appears to be encouraging some return to corn as a grain crop in sections of the State best adapted to the crop and where livestock production has been historically an important part of the farm enterprise. Increases in livestock numbers for the State as a whole are now evident.

Conditions contributing to the changes occurring in Kansas corn production during the period of 1928-39 have centered around the major factor of precipitation. High temperatures and excessively hot winds delivered the final destructive touch to many acres of corn in some years of this 12-year period, particularly since 1933. Annual precipitation has been less than the 50-year (1890-1939) average in 7 years of the 12. There has been some reduction in yield in recent years compared with that which would normally be expected when moisture and temperature conditions were more favorable.

In addition to unfavorable weather factors, other conditions contributing to reduced planted acreages have been the reduction in soil depleting crop acreages under the Agricultural Conservation Program and the broader recognition of the fact that sorghums have been more dependable as feed grain crops year after year in some sections.

Estimates presented here relate to corn for all purposes. The county acreage estimates are based primarily on the assessors' annual enumeration of crop acreages adjusted to the State total estimates made by the Crop Reporting Board. The production data are based primarily on harvested acre yields reported by crop correspondents. Yields per planted acre are derived from planted acreage and production. The yield and production estimates relate to the yield for grain plus an allowance for grain equivalent of yields for other purposes. The various base data are assembled and summarized annually, the estimates being made by the Agricultural Marketing Service in cooperation with the Kansas State Board of Agriculture.

K. E. Logan,  
Associate Agricultural Statistician.
